School Science Review June 2015, 96(357)

5 Editorial

7 Science notes
  7 A simple way to demonstrate that gases have mass Paul Elliott
  9 Explosions in disposable syringes Alan Goodwin

13 Theme editorial: Practical work I
  Michael J. Reiss

16 Practical work in science: misunderstood and badly used? Jonathan Osborne
  Assessment of practical work in science has little value unless the purpose of all practical work in learning is properly understood

25 Students' attitudes to practical work by age and subject Rachael Sharpe
  Student opinion of practical science varies from ‘new and exciting’ to valuable experience and on to a necessary chore that is only of marginal relevance to the learning essential for examinations

31 The practical work challenge: incorporating the explicit teaching of evidence in subject content
  Ros Roberts and Cath Reading
  Knowledge and understanding in science are not obtained only from books; experience of real materials and real events is essential

40 The assessment of practical skills
  Ian Abrahams and Michael J. Reiss
  Assessment of students’ performance as they are undertaking practical work or by making judgements from their written reports afterwards both have their place in assessment

45 The assessment of science practical skills: a historical perspective
  Nigel English and Stella Paes
  A look at how the assessment of practical science over the years can help in planning suitable methods for the future

54 How can the education system ensure students have an improved science learning experience?
  Peter Canning
  Developing a workable method for the assessment of practical skills with regard to a balance between open investigation and measureable achievement

59 Endorsing the practical endorsement? OCR's approach to practical assessment in science A-levels
  Steve Evans and Neil Wade
  One examination board’s view of a suitable direction for the assessment of skills in practical science

69 Practically perfect in every way: why it is essential that our young people engage with practical biology
  Sarah Cox
  Whether to develop understanding and learn about biology or to gain experience relevant to future careers, practical work and the handling of real materials are essential parts of student experience
75 The role of ‘practical’ work in teaching and learning chemistry
Keith S. Taber
Practical laboratory work is an important feature of chemistry courses but practical activities that effectively support student learning of chemical concepts require careful planning.

84 The resourcing of science in Scottish schools
Stuart Farmer, William Hardie and Sally Brown
Money spent on updating and replacing science equipment in schools in Scotland has been found to vary widely – how does this affect educational achievement?

90 How technicians can lead science improvements in any school: a small-scale study in England
Beth Jones and Simon Quinell
Technicians can lead an isolated existence; this scheme can enable them to share knowledge and skills through mutual support between institutions.

97 Using ICT to reinvigorate practical work in science
Neil Ingram
From desktop computers to smartphones, there are many options to avoid writing long-hand in notebooks, and these can help make the science education experience more effective.

105 Increasing students’ interest in science: the contribution of practical work
Helen Darlington
An in-school research project considers how various practical activities (such as handling apparatus, choosing investigations, solving puzzles and having peer-group discussions) can influence student interest in science.

114 Developing global competences by extended chemistry concept maps
Teresa Celestino and Marco Plumetti
Concept maps can be very useful in visualising interdisciplinary connections and highlighting the ethical issues involved.
